DANIELS, ANTHONY J

ART UNIT PAPER NUMBER

2615

DATE MAILED: 02/09/2005

Please find below and/or attached an Office communication concerning this application or proceeding.

Office Action Summary

Application No.

10/081,694

Applicant(s)

ZIEMKOWSKI, THEODORE B.

Examiner

Anthony J. Daniels

Art Unit

2615

-- The MAILING DATE of this communication appears on the cover sheet with the correspondence address --
Period for Reply

A SHORTENED STATUTORY PERIOD FOR REPLY IS SET TO EXPIRE 3 MONTH(S) FROM THE MAILING DATE OF THIS COMMUNICATION.

- Extensions of time may be available under the provisions of 37 CFR 1.136(a). In no event, however, may a reply be timely filed after SIX (6) MONTHS from the mailing date of this communication.
- If the period for reply specified above is less than thirty (30) days, a reply within the statutory minimum of thirty (30) days will be considered timely.
- If NO period for reply is specified above, the maximum statutory period will apply and will expire SIX (6) MONTHS from the mailing date of this communication.
- Failure to reply within the set or extended period for reply will, by statute, cause the application to become ABANDONED (35 U.S.C. § 133). Any reply received by the Office later than three months after the mailing date of this communication, even if timely filed, may reduce any earned patent term adjustment. See 37 CFR 1.704(b).

Status

- 1) ☐ Responsive to communication(s) filed on ____.
- 2a) ☐ This action is **FINAL**. 2b) ☒ This action is non-final.
- 3) ☐ Since this application is in condition for allowance except for formal matters, prosecution as to the merits is closed in accordance with the practice under *Ex parte Quayle*, 1935 C.D. 11, 453 O.G. 213.

Disposition of Claims

- 4) ☒ Claim(s) 1-28 is/are pending in the application.
- 4a) Of the above claim(s) ____ is/are withdrawn from consideration.
- 5) ☐ Claim(s) ____ is/are allowed.
- 6) ☒ Claim(s) 1-28 is/are rejected.
- 7) ☐ Claim(s) ____ is/are objected to.
- 8) ☐ Claim(s) ____ are subject to restriction and/or election requirement.

Application Papers

- 9) ☐ The specification is objected to by the Examiner.
- 10) ☒ The drawing(s) filed on 22 February 2002 is/are: a) ☒ accepted or b) ☐ objected to by the Examiner.
Applicant may not request that any objection to the drawing(s) be held in abeyance. See 37 CFR 1.85(a).
Replacement drawing sheet(s) including the correction is required if the drawing(s) is objected to. See 37 CFR 1.121(d).
- 11) ☐ The oath or declaration is objected to by the Examiner. Note the attached Office Action or form PTO-152.

Priority under 35 U.S.C. § 119

- 12) ☐ Acknowledgment is made of a claim for foreign priority under 35 U.S.C. § 119(a)-(d) or (f).
a) ☐ All b) ☐ Some * c) ☐ None of:
1. ☐ Certified copies of the priority documents have been received.
2. ☐ Certified copies of the priority documents have been received in Application No. ____.
3. ☐ Copies of the certified copies of the priority documents have been received in this National Stage application from the International Bureau (PCT Rule 17.2(a)).
- * See the attached detailed Office action for a list of the certified copies not received.

Attachment(s)

- 1) ☒ Notice of References Cited (PTO-892)
- 2) ☐ Notice of Draftsperson's Patent Drawing Review (PTO-948)
- 3) ☒ Information Disclosure Statement(s) (PTO-1449 or PTO/SB/08)
Paper No(s)/Mail Date 2/22/02
- 4) ☐ Interview Summary (PTO-413)
Paper No(s)/Mail Date. ____
- 5) ☐ Notice of Informal Patent Application (PTO-152)
- 6) ☐ Other: ____

DETAILED ACTION

Claim Rejections - 35 USC § 102

The following is a quotation of the appropriate paragraphs of 35 U.S.C. 102 that form the basis for the rejections under this section made in this Office action:

A person shall be entitled to a patent unless –

(b) the invention was patented or described in a printed publication in this or a foreign country or in public use or on sale in this country, more than one year prior to the date of application for patent in the United States.

1. Claims 1,3,4,8,17,18,20-22 are rejected under 35 U.S.C. 102(b) as being anticipated by Steinberg et al. (US # 6,006,039).

As to claim 1, Steinberg et al. teaches a digital image capturing system (see Figure 1, cameras “10,” “12”) comprising: at least two digital image capturing devices (see Figure 1, cameras “10,” “12”); and a bi-directional link cable (see Col. 3, Lines 52-54) connecting said at least two digital image capturing devices (see Figure 1, cable “28”); wherein said at least two digital image capturing devices are capable of sharing data items over said bi-directional link cable (see Col. 3, Lines 52-54).

As to claim 3, Steinberg et al. teaches the device of claim 1, wherein the sharing of said data items comprises sharing images (see Col. 2, Lines 33-35, “...with a particular image data,”).

As to claim 4, Steinberg et al. teaches the device of claim 1, wherein the sharing of said data items comprises sharing image information (see Col. 2, Lines 33-35, “...downloading of graphics and textual information to be included with a particular image data,”).

As to claim 8, Steinberg et al. teaches the device of claim 1, wherein a digital image capturing device of said at least two digital image capturing devices operates as a pseudo host

Art Unit: 2615

(see Col. 3, Lines 52-54; *{The digital camera that transmits, or uploads, the data to the other digital camera is the pseudo host.}*).

As to claim 17, Steinberg et al. teaches a method of linking a first digital image capturing device to one or more other digital image capturing devices (see Figure 1, cameras “10,” “12”, and cable “28”), comprising the steps of: providing at least two digital image capturing devices capable of sending and receiving data items over a bi-directional link cable (see Col. 3, Lines 52-54); and providing I/O ports on said at least two digital image capturing devices (see Figure 1, port “16” on both cameras; Col. 3, Lines 52-54).

As to claim 18, Steinberg et al. teaches the method of claim 17, further comprising the step of sharing data items (see Col. 3, Lines 52-54).

As to claim 20, claim 20 is a method claim corresponding to the apparatus claim 3. Therefore, claim 20 is analyzed and rejected as previously discussed with respect to the apparatus claim 3.

As to claim 21, claim 21 is a method claim corresponding to the apparatus claim 4. Therefore, claim 21 is analyzed and rejected as previously discussed with respect to the apparatus claim 4.

As to claim 22, Steinberg et al. teaches the method of claim 17, with the step of providing at least two digital image capturing devices (see Figure 1, cameras “10,” “12”) further comprising providing one or more digital image capturing devices capable of operating as a pseudo host (see Col. 3, Lines 52-54; *{The digital camera that transmits, or uploads, the data to the other digital camera is the pseudo host.}*).

Claim Rejections - 35 USC § 103

The following is a quotation of 35 U.S.C. 103(a) which forms the basis for all obviousness rejections set forth in this Office action:

(a) A patent may not be obtained though the invention is not identically disclosed or described as set forth in section 102 of this title, if the differences between the subject matter sought to be patented and the prior art are such that the subject matter as a whole would have been obvious at the time the invention was made to a person having ordinary skill in the art to which said subject matter pertains. Patentability shall not be negated by the manner in which the invention was made.

2. Claims 2,19 are rejected under 35 U.S.C. 103(a) as being unpatentable over Steinberg et al. (see Patent Number above) in view of Kiyokawa (6,204,877).

As to claim 2, Steinberg et al. teaches the device of claim 1. The claim differs from Steinberg et al. in that it further requires that the sharing of data items comprises sharing real time views.

In the same field of endeavor, Kiyokawa teaches the transmission of image data from an electronic imaging apparatus to an electronic image pickup apparatus in real time (see Col. 2, Lines 13-18; "...transmitting *upon* photoelectric conversion..."). In light of the teaching of Kiyokawa, it would have been obvious to one of ordinary skill in the art at the time the invention was made to modify the system of Steinberg et al. to include real time transmission of the images data, as taught by Kiyokawa, because an artisan of ordinary skill in the art would recognize that real time transmission of image data allows users of the system to be view on a particular scene, in real time, even if they are not physically in the vicinity or witnessing the scene.

As to claim 19, claim 19 is a method claim corresponding to the apparatus claim 2. Therefore, claim 19 is analyzed and rejected as previously discussed with respect to the apparatus claim 2.

3. Claims 5,6 are rejected under 35 U.S.C. 103(a) as being unpatentable over Steinberg et al. (see Patent Number above).

As to claim 5, Steinberg et al. fails to teach the bidirectional link cable comprising an audio/visual (A/V) cable. **Official Notice** is taken that audio/visual (A/V) cables are well known and expected in the art. It would have been obvious to an artisan of ordinary skill in the art to include an audio/visual (A/V) cable as a bidirectional link cable in Steinberg et al., because these cables are space efficient, as pertains to the manufacturing of the port to which it is connected, and can be used to transmit data of high fidelity over several meters.

As to claim 6, Steinberg et al. fails to teach the bidirectional link cable comprising a universal serial bus (USB) cable. **Official Notice** is taken that universal serial bus (USB) cables are well known and expected in the art. It would have been obvious to an artisan of ordinary skill in the art to include a universal serial bus (USB) cable as a bidirectional link cable in Steinberg et al., because these cables offers high-speed transmission of data, and are compatible with many other digital products.

4. Claims 7,9,10,12-16,23,24,26-28 are rejected under 35 U.S.C. 103(a) as being unpatentable over Steinberg et al. (see Patent Number above) in view of Watanabe (US 20020196197).

As to claim 7, Steinberg et al. teaches the device of claim 1, with a digital image capturing device of said at least two digital image capturing devices (see Figure 1, camera "10") further comprising: an input/output (I/O) port (see Figure 1, port "16"; Col. 3, Lines 52-54) capable of connecting to said bi-directional link cable (see Figure 1, cable "28"; Col. 3, Lines 52-

Art Unit: 2615

54); a processor communicating with said I/O port (see Figure 4, processor “122”, cable connector (port) “16”, bus line “136”; Col. 7, Lines 6-8)); and a memory communicating with said processor (see Figure 4, memory “126”, processor “122”, bus line “124”) and including an image storage (see Col. 7, Line 21), an image receive driver, and an image transmit drive (*The examiner is interpreting an image receive driver and image transmit driver in a way, such that, it would be inherent that memory contain software that drive the transmission and reception of image data; furthermore, applicant is advised to refer to Col. 7, Lines 16-20 in Steinberg et al.*); wherein, said processor determines if said digital image capturing device is a master or a slave (*The examiner is interpreting an image capturing device as a master or a slave, such that it would be inherent that a camera in the system of Steinberg et al. would be declared the master by the initial transfer of data, and by default, the receiving camera would be the slave.*), and shares said data items over said bi-directional link cable (see Col. 3, Lines 52-54). The claim differs from Steinberg et al. in that it further requires that said processor determines if said I/O port is connected to said bi-directional link cable.

In the same field of endeavor, Watanabe teaches connection detection means for detecting a connection state between a computer and a digital camera (see [0231], Lines 1-6). In light of the teaching of Watanabe, it would have been obvious to one of ordinary skill in the art at the time the invention was made to include the connection detection means of Watanabe in the system of Steinberg et al., because an artisan of ordinary skill in the art would recognize that this connection detection means would prevent accidental transfer without a cable, which would cause a loss of data, thereby making the camera system safer and more efficient.

As to claim 9, Steinberg et al. teaches a digital image capturing device, comprising: an input/output (I/O) port (see Figure 1, port “16”; Col. 3, Lines 52-54) capable of connecting to said bi-directional link cable (see Figure 1, cable “28”; Col. 3, Lines 52-54); a processor communicating with said I/O port (see Figure 4, processor “122”, cable connector (port) “16”, bus line “136”; Col. 7, Lines 6-8)); and a memory communicating with said processor (see Figure 4, memory “126”, processor “122”, bus line “124”) and including an image storage (see Col. 7, Line 21), an image receive driver, and an image transmit driver (*The examiner is interpreting an image receive driver and image transmit driver in a way, such that, it would be inherent that memory contain software that drive the transmission and reception of image data; furthermore, applicant is advised to refer to Col. 7, Lines 16-20 in Steinberg et al.*); wherein, said processor determines if said digital image capturing device is a master or a slave (*The examiner is interpreting an image capturing device as a master or a slave, such that it would be inherent that a camera in the system of Steinberg et al. would be declared the master by the initial transfer of data, and by default, the receiving camera would be the slave.*), and shares said data items over said bi-directional link cable (see Col. 3, Lines 52-54). The claim differs from said processor determines if said I/O port is connected to said bi-directional link cable.

In the same field of endeavor, Watanabe teaches a connection detection means for detecting a connection state between a computer and a digital camera (see [0231], Lines 1-6). In light of the teaching of Watanabe, it would have been obvious to one of ordinary skill in the art at the time the invention was made to include the connection detection means of Watanabe in the system of Steinberg et al., because an artisan of ordinary skill in the art would recognize that this

connection detection means would allow the image transfer system to start without switching from the user.

As to claim **10**, Steinberg et al., as modified by Watanabe, teaches the device of claim 9, wherein the sharing of said data items comprises transmitting and receiving data items (see Steinberg et al., Col. 3, Lines 52-54).

As to claim **12**, Steinberg et al., as modified by Watanabe, teaches the device of claim 9, wherein the sharing of said data items comprises sharing images (see Steinberg et al., Col. 2, Lines 33-35, "...with a particular image data,").

As to claim **13**, Steinberg et al., as modified by Watanabe, teaches the device of claim 9, wherein the sharing of said data items comprises sharing image information (see Steinberg et al., Col. 2, Lines 33-35, "...downloading of graphics and textual information to be included with a particular image data,").

As to claim **14**, Steinberg et al., as modified by Watanabe, fails to teach the bidirectional link cable comprising an audio/visual (A/V) cable. **Official Notice** is taken that audio/visual (A/V) cables are well known and expected in the art. It would have been obvious to an artisan of ordinary skill in the art to include an audio/visual (A/V) cable as a bidirectional link cable in Steinberg et al., as modified by Watanabe, because these cables are space efficient, as pertains to the manufacturing of the port to which it is connected, and can be used to transmit data of high fidelity over several meters.

As to claim **15**, Steinberg et al., as modified by Watanabe, fails to teach the bidirectional link cable comprising a universal serial bus (USB) cable. **Official Notice** is taken that universal serial bus (USB) cables are well known and expected in the art. It would have been obvious to an

Art Unit: 2615

artisan of ordinary skill in the art to include a universal serial bus (USB) cable as a bidirectional link cable in Steinberg et al., as modified by Watanabe, because these cables offers high-speed transmission of data, and are compatible with many other digital products.

As to claim 16, Steinberg et al., as modified by Watanabe, teaches the device of claim 9, wherein said digital image capturing device operates as a pseudo host (see Steinberg et al., Col. 3, Lines 52-54; *{The digital camera that transmits, or uploads, the data to the other digital camera is the pseudo host.}*).

As to claim 23, Steinberg et al., as modified by Watanabe teaches the method of claim 17, further comprising the steps of: detecting a connection of a bi-directional link cable in said digital image capturing device (see Watanabe, [0231], Lines 1-6); accepting a master or slave input that determines whether said digital image capturing device is a master or a slave (*The examiner is interpreting an image capturing device as a master or a slave, such that it would be inherent that a camera in the system of Steinberg et al. would be declared the master by the initial transfer of data, and by default, the receiving camera would be the slave.*); accepting an image selection of a first data item to be sent to a connected slave digital image capturing device if said digital image capturing device is a master (*The examiner is interpreting the accepting of an image selection of a first data item to be sent to a connected slave digital imaging capture device if said digital image capturing device is a master, such that it would be inherent that a master digital image capturing device transmit a specified image data to the slave.*); transmitting said first data item to said connected slave digital image capturing device if said digital image capturing device is a master (*This is inherent in the digital image capturing device that is the master to transmit image data*), accepting a second data item from a connected master digital

Art Unit: 2615

image capturing device if said digital image capturing device is a slave (*This is inherent in the digital image capturing device that is the slave to receive image data from the master.*); and displaying said second data item on said digital image capturing device if said digital image capturing device is a slave (see Steinberg et al., Col. 2, Lines 52-55; *{It is inherent in an image capturing device that an image stored on the device can be displayed, regardless of whether it is a master or a slave.}*).

As to claim 24, Steinberg et al. teaches a method of linking a first digital image capturing device to one or more digital image capturing devices, comprising the steps of: accepting a master or slave input that determines whether said digital image capturing device is a master or a slave (*The examiner is interpreting an image capturing device as a master or a slave, such that it would be inherent that a camera in the system of Steinberg et al. would be declared the master by the initial transfer of data, and by default, the receiving camera would be the slave.*); accepting an image selection of a first data item to be sent to a connected slave digital image capturing device if said digital image capturing device is a master (*The examiner is interpreting the accepting of an image selection of a first data item to be sent to a connected slave digital imaging capture device if said digital image capturing device is a master, such that it would be inherent that a master digital image capturing device transmit a specified image data to the slave.*); transmitting said first data item to said connected slave digital image capturing device if said digital image capturing device is a master (*This is inherent in the digital image capturing device that is the master to transmit image data*), accepting a second data item from a connected master digital image capturing device if said digital image capturing device is a slave (*This is inherent in the digital image capturing device that is the slave to receive image data from the*

Art Unit: 2615

master.); and displaying said second data item on said digital image capturing device if said digital image capturing device is a slave (see Col. 2, Lines 52-55; *{It is inherent in an image capturing device that an image stored on the device can be displayed, regardless of whether it is a master or a slave.}*). The claim differs from said processor determines if said I/O port is connected to said bi-directional link cable.

In the same field of endeavor, Watanabe teaches connection detection means for detecting a connection state between a computer and a digital camera (see [0073]). In light of the teaching of Watanabe, it would have been obvious to one of ordinary skill in the art at the time the invention was made to include the connection detection means of Watanabe in the system of Steinberg et al., because an artisan of ordinary skill in the art would recognize that this connection detection means would allow the image transfer system to start without switching from the user.

As to claim **26**, Steinberg et al., as modified by Watanabe, teaches the method of claim 24, wherein the first digital image capturing device and the second digital image capturing device share images (see Steinberg et al., Col. 2, Lines 33-35, "...with a particular image data,").

As to claim **27**, Steinberg et al., as modified by Watanabe teaches the method of claim 24, wherein the first digital image capturing device and the second digital image capturing device share image information (see Steinberg et al., Col. 2, Lines 33-35, "...downloading of graphics and textual information to be included with a particular image data,").

As to claim **28**, Steinberg et al., as modified by Watanabe, teaches the method of claim 24, wherein a master digital image capturing device operates as a pseudo host (see Steinberg et

al., Col. 3, Lines 52-54; *{The digital camera that transmits, or uploads, the data to the other digital camera is the pseudo host.}*).

4. Claims 11,25 are rejected under 35 U.S.C. 103(a) as being unpatentable over Steinberg et al. (see Patent number above) in view of Watanabe (see Patent Number above) and further in view of Kiyokawa (see Patent Number above).

As to claim 11, Steinberg et al., as modified by Watanabe, teaches the device of claim 9. The claim differs from Steinberg et al., as modified by Watanabe, in that it further requires the sharing of said data items comprise sharing real time image views.

In the same field of endeavor, Kiyokawa teaches the transmission of image data from an electronic imaging apparatus to an electronic image pickup apparatus in real time (see Col. 2, Lines 13-18; "...transmitting *upon* photoelectric conversion..."). In light of the teaching of Kiyokawa, it would have been obvious to one of ordinary skill in the art at the time the invention was made to modify the system of Steinberg et al., as modified by Watanabe, to include real time transmission of the images data, as taught by Kiyokawa, because an artisan of ordinary skill in the art would recognize that real time transmission of image data allows users of the system to be view on a particular scene, in real time, even if they are not physically in the vicinity or witnessing the scene.

As to claim 25, Steinberg et al., as modified by Watanabe, teaches the method of claim 24. The claim differs from Steinberg et al., as modified by Watanabe, in that it further requires that the first digital image capturing device and the second digital image capturing device share real time image views.

In the same field of endeavor, Kiyokawa teaches the transmission of image data from an electronic imaging apparatus to an electronic image pickup apparatus in real time (see Col. 2, Lines 13-18; "...transmitting *upon* photoelectric conversion..."). In light of the teaching of Kiyokawa, it would have been obvious to one of ordinary skill in the art at the time the invention was made to modify the system of Steinberg et al., as modified by Watanabe, to include real time transmission of the images data, as taught by Kiyokawa, because an artisan of ordinary skill in the art would recognize that real time transmission of image data allows users of the system to be view on a particular scene, in real time, even if they are not physically in the vicinity or witnessing the scene.

Conclusion

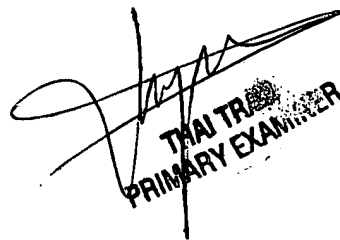

5. Any inquiry concerning this communication or earlier communications from the examiner should be directed to Anthony J. Daniels whose telephone number is (703) 305-4807. The examiner can normally be reached on 8:00 A.M. - 4:30 P.M..

If attempts to reach the examiner by telephone are unsuccessful, the examiner's acting supervisor, Thai Tran can be reached on (703) 305-4725. The fax phone number for the organization where this application or proceeding is assigned is 703-872-9306.
